

More accurate scaling

0.7mm small caliber nozzle

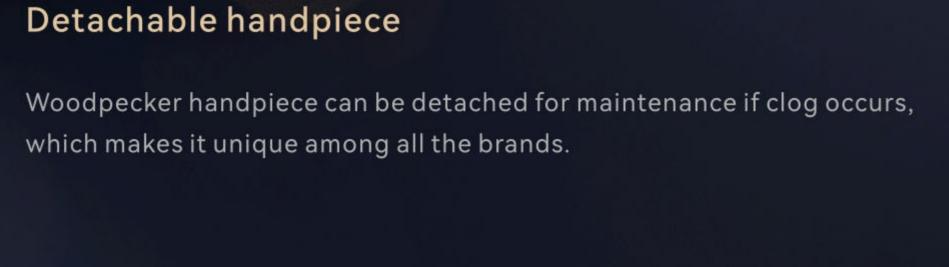

More concentrated powder output

0.7mm Nozzle caliber for powder measures 0.7mm

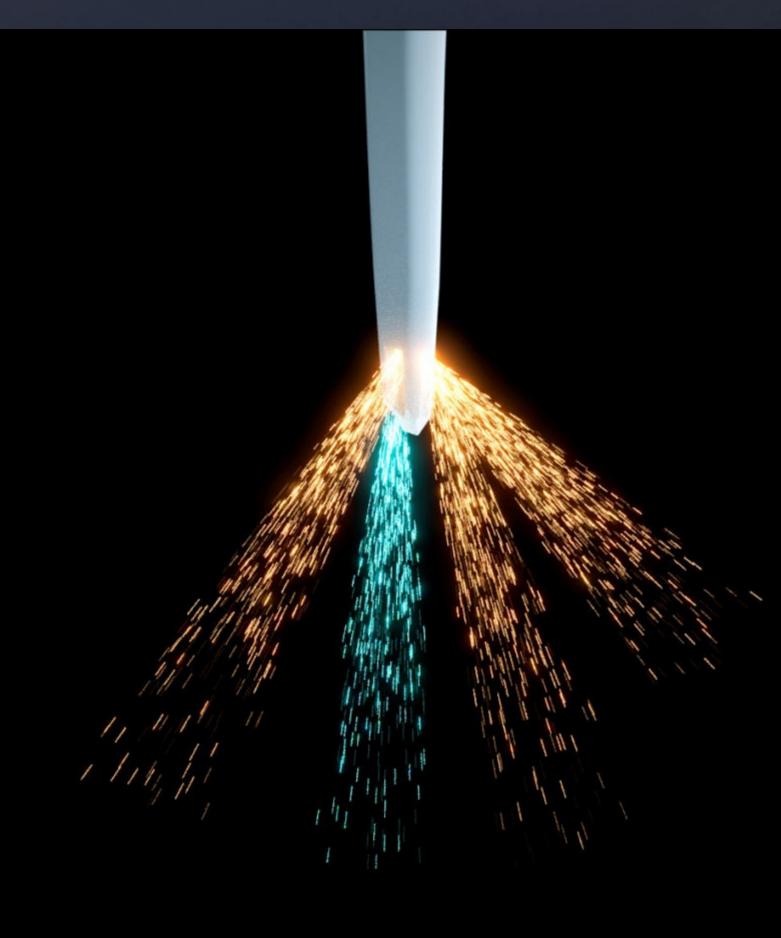

1.4mm Nozzle caliber for water measures 1.4mm Smaller caliber allows more concentrated air polishing Companies on the market with dental air polisher of 0.7mm small caliber nozzle include Woodpecker, EMS and NSK.

0.7mm

1.4mm

Three-section air-polishing handpiece design

Three-direction powder output One-direction water output

Pre-bendable subgingival nozzle

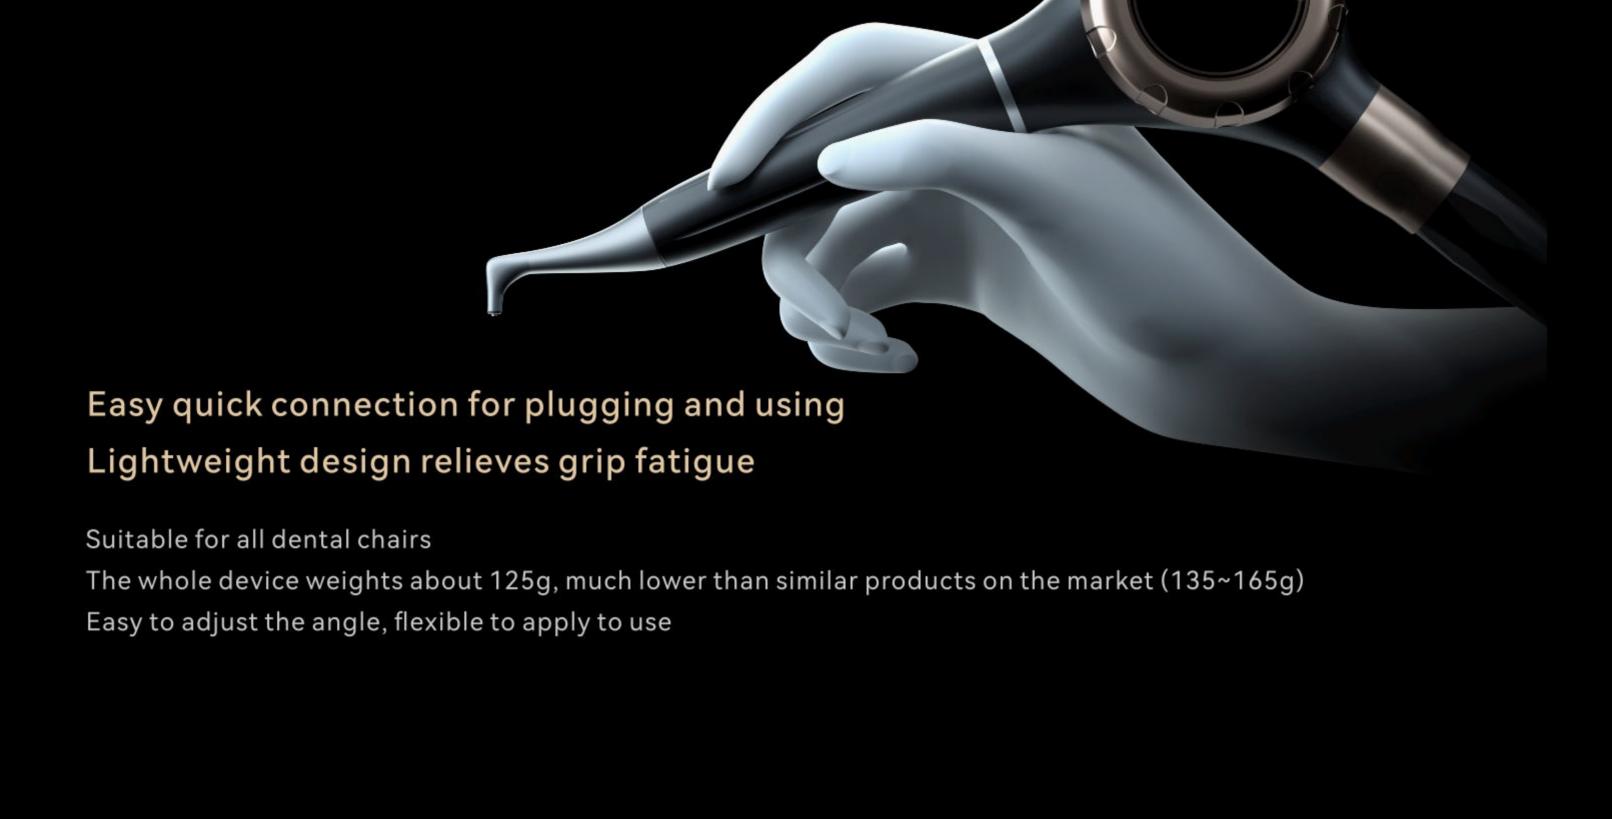

Efficiently eliminate biofilms Thoroughly clear dead ends

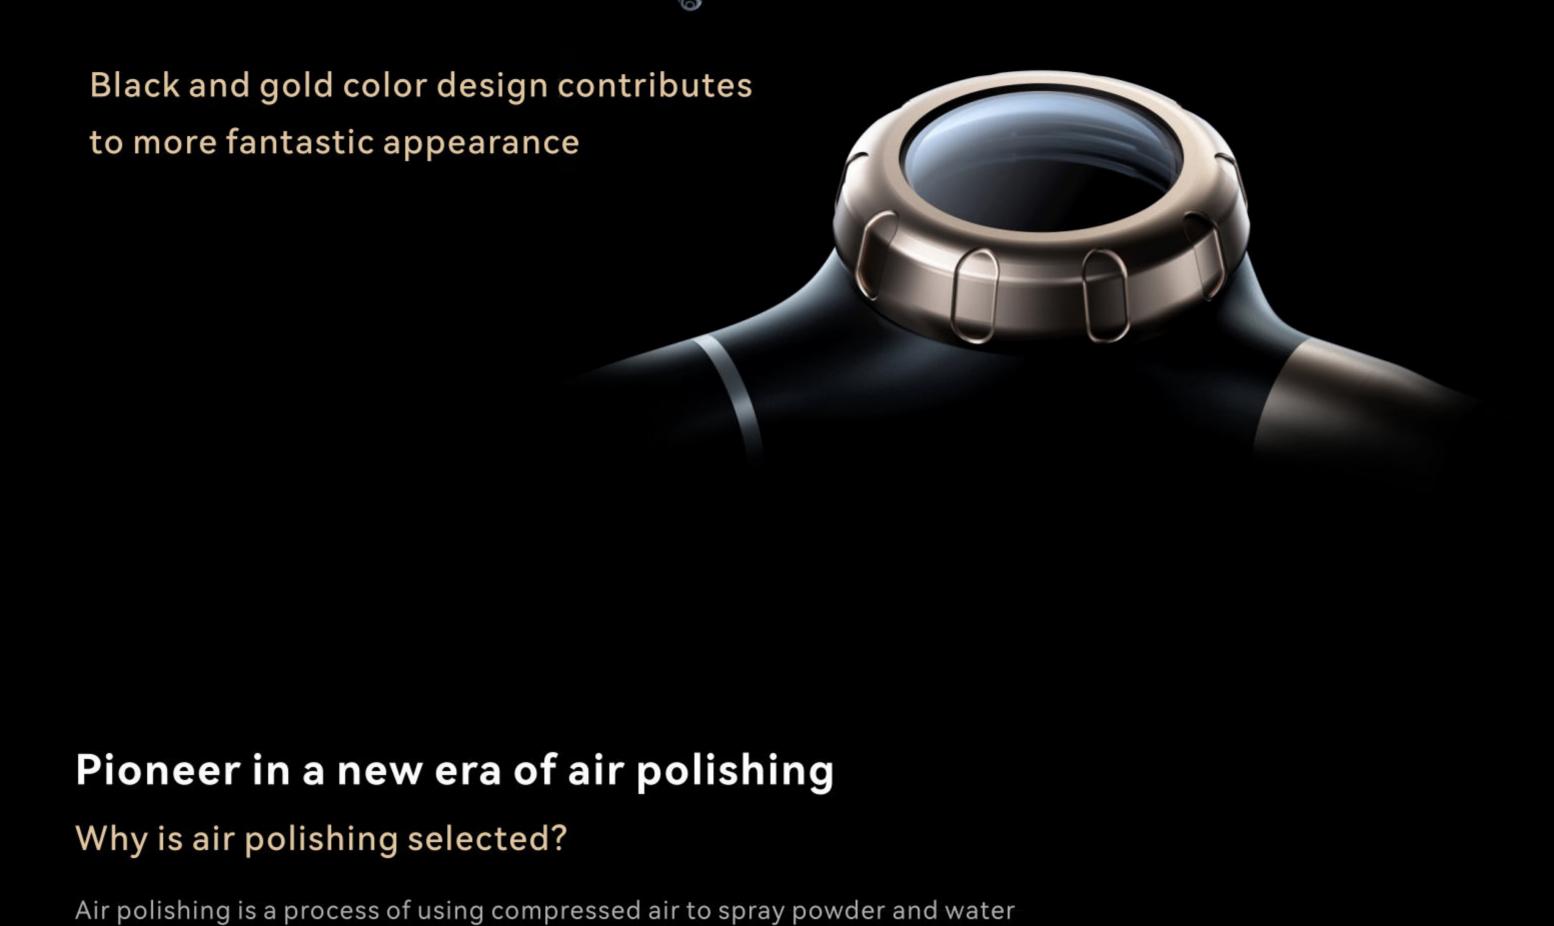

360° rotatable

Ergonomic design

More flexible and lightweight

so as to reduce patient's tension.

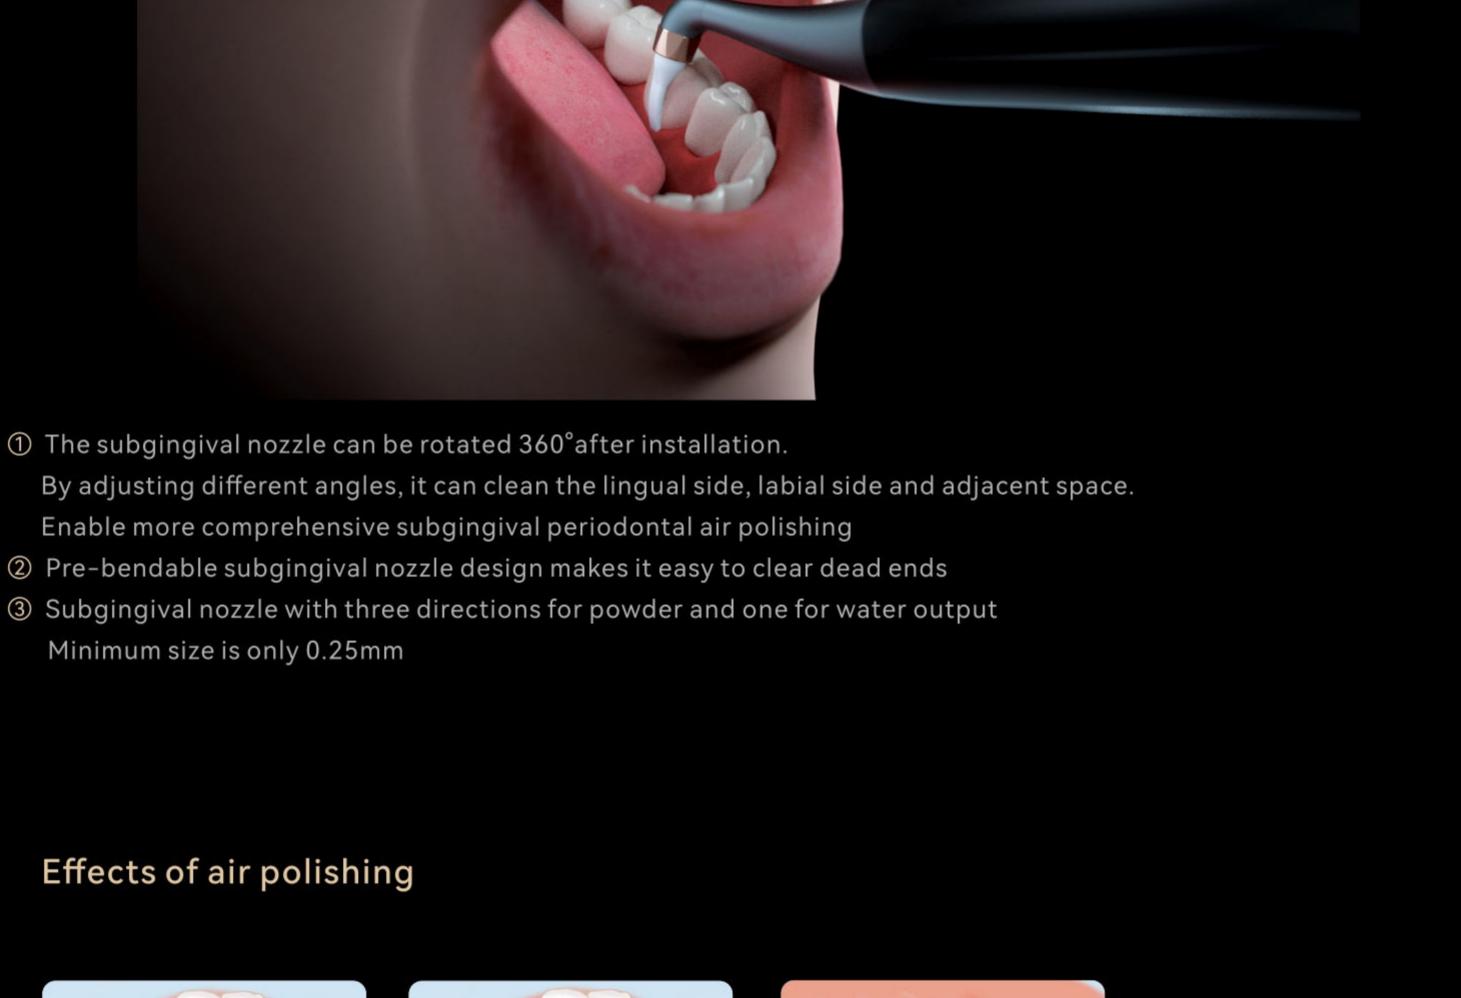

on the tooth surface through air-polishing equipment to remove the attachments

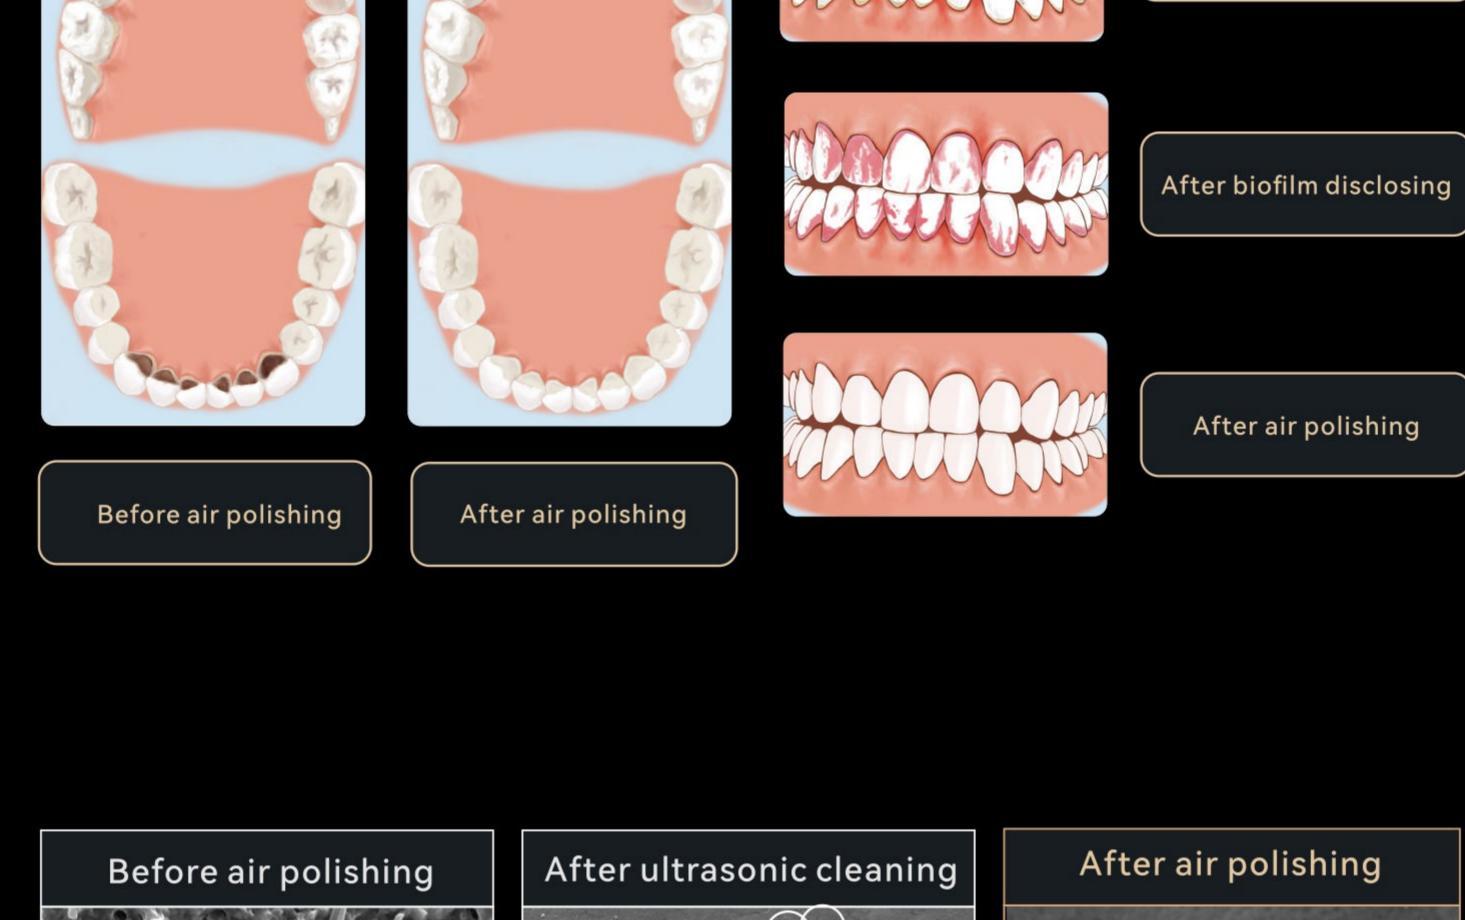

Air polishing has become an indispensable tool for biofilm control in the new era.

causing no scratch to the tooth surface, and is less likely to harm soft tissues,

Compared with traditional ultrasonic scaling, air polishing is more efficient and comfortable,

(such as biofilm, pigment, soft dirt, etc.) and polish the tooth surface.

Small amount of

some seratches

biofilm residue and

Before air polishing

Almost no biofilm residue,

no scratches

10µm

Effective protection of tooth surface

Large amount of biofilm

Therefore, our teeth can be protected better during cleaning, avoiding the tooth surface damage caused by excessive traditional scaling so as to improve the experience and compliance of customers.

The hardness of the air-polishing powder is much lower than that of the enamel.

10µm
